## APPENDIX A - RESEARCHSCAPE METHODOLOGY

This online survey had 573 respondents. It was fielded first on December 30, 2020 and most recently on January 4, 2021.

As this was not a probability-based sample, calculating the theoretical margin of sampling error is not applicable. However, as with probability surveys, it is important to keep in mind that results are estimates and typically vary within a narrow range around the actual value that would be calculated by completing a census of everyone in a population. One estimate of this precision is the credibility interval; for this survey, the credibility interval is plus or minus 6 percentage points for questions answered by all respondents (the interval is larger for questions answered by fewer respondents). Again, as with probability surveys, on occasion the results from a particular question will be completely outside a typical interval of error.

There are many types of survey errors that can limit the ability to generalize to a population. Throughout the research process, Researchscape followed a Total Survey Quality approach designed to minimize error at each stage. Total Survey Quality, also known as Total Survey Error, recognizes that multiple sources of error can reduce the validity of survey research. Besides sampling error, five types of non-sampling error can occur: specification error, frame error, nonresponse error, measurement error, and processing error. At each step in the survey research process, the research team followed best practices and used quality controls to minimize the impact of these sources of error. Panel surveys sometimes suffer from inattentive respondents or spam. Researchscape followed a 43-step process for data cleansing, profiling responses on five behaviors (inattentiveness, speed of response, straight-lining, poor verbatim responses, and suspicious IP activity). Any respondent committing two or more penalties was removed from the data set; research on research has shown that results are less representative when excluding respondents who commit one penalty, as any one behavior might be typical of that respondent or a momentary lapse of attentiveness. Researchscape is confident that the information gathered from this survey can be used to make important business decisions related to this topic.
